of the municipal
territory

Universal Inclusion

Democratic access
for all

The Challenge of Municipal Management

Municipalities today face a mismatch between the wealth of their territory and their ability to communicate with those who circulate within it. We have identified three critical gaps in modern public management:

1

"Mobility Blindness"

The Municipal Administration knows where visitors sleep, but loses visibility of the flow of people during their journey. There is no data on which routes are used, what stories are consumed, and how the actual dispersal across the territory occurs.

2

Institutional Silence

As citizens and visitors move through the city, they consume information from third-party platforms. The municipality lacks an agile official channel to deliver its narrative, cultural agenda, and public service announcements at the precise moment.

3

Flow Inequality

Tourism and economic activity are concentrated in the city center or iconic locations, leaving neighborhoods, parishes, and peripheral heritage "invisible," thus limiting income distribution.

Municipal Digital Infrastructure

Tuggi is a Contextual Communication Technology Infrastructure. We provide the Municipality with an Operating System (City OS) and an Official Application (White Label) that function as a digital layer of intelligence over the physical territory.

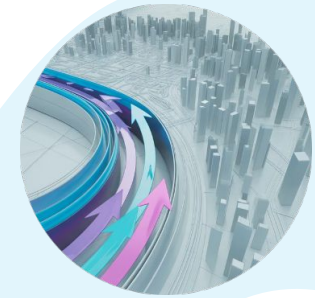

Official Communication Channel

We've transformed commutes into moments of direct contact. The Municipality communicates its history, cultural agenda, festivals, service alerts, and campaigns directly to citizens on the go.

Narrative Sovereignty

The Municipal Government retains full editorial control. Through the CMS (Municipal Social Communication Office), the city establishes the official narrative, ensuring historical accuracy and protection against misinformation.

Active Flow Management

Intelligent itineraries encourage visitors to disperse to less densely populated areas, promoting economic development throughout the territory.

Universal Accessibility

Universal Design and Equity. We eliminate linguistic and sensory barriers, delivering immersive audio, full text, and mobility metadata for everyone.

Heritage Education

A tool that primarily serves the residents. By revealing the history and schedules of daily commutes, we transform residents into active ambassadors for the municipality.

User Experience

The solution was designed with a focus on **Immersion and Equity**, operating on the Hands-Free and Eyes-on-Road concept. The technology adapts to the visitor's needs to ensure complete autonomy.

For the International Visitor

The city "speaks" the tourist's language. The app detects the device's language and delivers the translated narrative automatically. The user is free to manually select their preferred language.

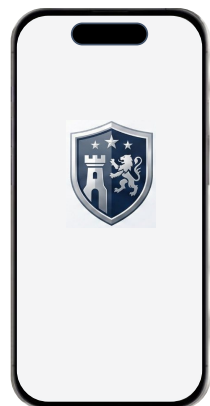

Full Inclusion

Visual barriers: Audio-First narrative, describing the environment in detail

Deaf community: Full mirrored text in the interface

Reduced mobility: Information on parking, adapted restrooms, and terrain type

Multilingual Inclusion: With a simple touch, the user can change the reading and listening language.

The City's Identity

The app will bear the city's name and use Tuggi technology, combining the best of both worlds.

The Management Map

Through City OS, the city departments have complete control over their city's tourism information, enabling them to plan tourism and cultural activities for the municipality in advance.

Simplified Operational Flow

The system connects municipal management directly to the citizen, without intermediaries.

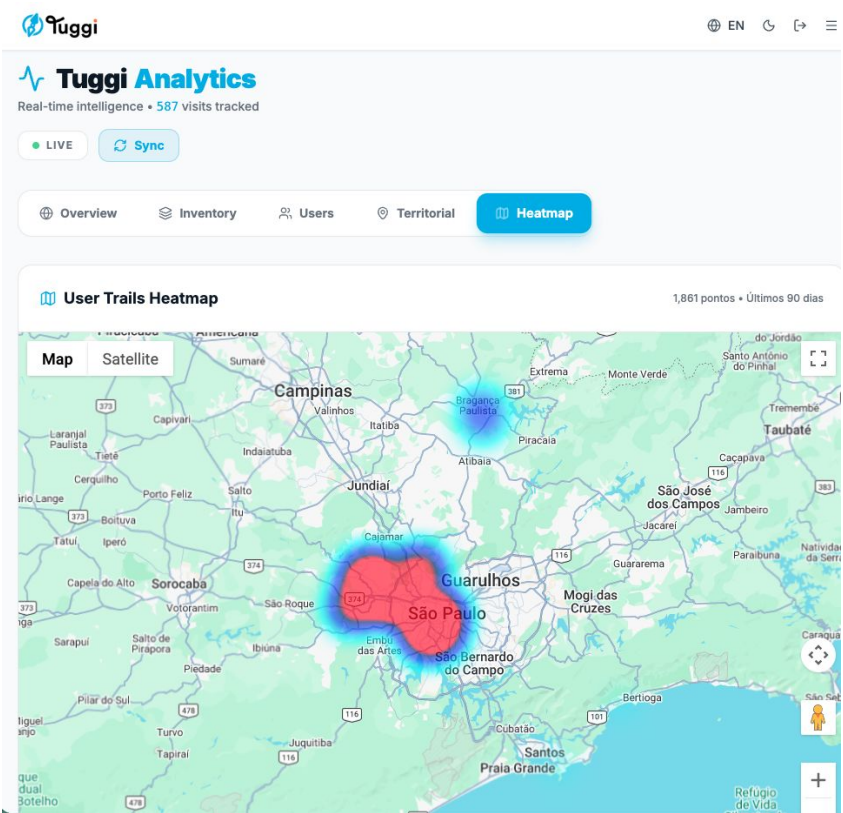

Our technology processes location, automatically translates content into multiple languages, and generates studio-quality audio while the user moves through the territory.

Evidence-Based Management

More than just communication, the infrastructure is a territorial intelligence tool in compliance with data protection laws (LGPD/GDPR). The Municipality will now have access to a Monthly Intelligence Report.

Strategic Indicators:

- **Heat Maps:** Real-time visualization of where people circulate and which areas are underutilized
- **Real Interest:** Ranking of the points and themes most consumed by the public
- **Language Metrics:** Data on the linguistic origin of visitors to target advertising
- **Territorial Dispersion:** Comparison between the central zone and peripheral areas

IMPLEMENTATION

B2G Implementation Model

We adopted an agile implementation model, designed to deliver a functional digital asset in a short timeframe, without burdening the city hall's IT team.

1

Phase 1: Setup and Digitization

30-60 Days

Importing official data, curating narratives, configuring the White Label App, and launching it in the app stores.

2

Phase 2: Operation and Intelligence

Monthly

Technical maintenance, schedule/alert updates, and sending data reports.

Technical Responses and Requirements

Frequently Asked Questions for Public Managers and Technical Teams:

What type of content can the City broadcast?

The infrastructure allows for simultaneous layers:

1. Historical-Cultural Narrative (fixed)
2. Agenda and Public Utility (temporary)
3. Thematic and Inclusive Routes with accessibility metadata

Is it necessary to download the application?

Yes. To guarantee the channel's sovereignty and technical functionality. The GPS works accurately even offline, and the citizen downloads a product with the official municipal brand, conveying confidence.

How does the visitor activate the system?

Friction is minimal. By downloading the app from your mobile phone's app store, creating a quick account, and you're ready to use it. It's possible to distribute Smart QR Codes on tourist signage, hotels, events, and entrance gates. By scanning the code, the user is directed to the Official App.

Next Steps

Tuggi presents itself as the technological partner to transform the territorial communication of the Municipality.

We suggest scheduling a Technical Presentation (30 min) to demonstrate the Control Panel (City OS) in real time and discuss its implementation for the next season.

Transform the communication in your territory.

Contact us to schedule a personalized demonstration and discover how Tuggi infrastructure can revolutionize the management and communication of your municipality.
